Modernize or Rebuild

A practical guide for architecture decisions

Outcome

Decide whether to rebuild or improve what you already have, with less risk.

Diagnose

See where work is getting stuck.

Decide

Choose one next move.

Execute

Move with a practical plan.

Best for CTO and Engineering | Topic: Architecture

amalgam-inc.com/playbooks

One-page summary

Decide whether to rebuild or improve what you already have, with less risk. This guide gives you a practical path from uncertainty to action.

- Best for: CTO and Engineering
- Topic: Architecture
- Read this first, then jump to the section that matches your pressure.
- Use one page at a time during real team decisions.

When to use

Use this playbook when these conditions start showing up in your team.

- Core systems feel fragile, slow, or expensive to maintain.
- Engineering effort keeps rising while confidence falls.
- Leadership debates rebuild vs modernize every planning cycle.
- Architecture concerns now block roadmap commitments.

Symptoms checklist

Check everything that feels true right now.

- [ ] Incident frequency rises despite stabilization effort.
- [ ] Small changes require broad regression effort.
- [ ] Critical modules are owned by too few engineers.
- [ ] Integration work dominates sprint capacity.
- [ ] Operating cost grows faster than value shipped.

Decision framework

Use these four lenses together. If one lens is weak, the decision usually gets risky fast.

Business value

What value must improve in the next 6 to 12 months?

Technical risk

What failures could materially affect delivery or trust?

Execution capacity

Can the team migrate without freezing product goals?

Decision window

How long can this call be delayed before risk compounds?

Step-by-step approach (part 1)

Use these steps in order. Keep each step simple and observable.

- Define success in business terms before architecture debate.
- Assess system health by domain, not one global score.
- Separate urgent reliability work from strategic modernization.

Step-by-step approach (part 2)

Finish the sequence and confirm what changed before adding more scope.

- Model rebuild and modernize options with timing and risk.
- Choose one approach per domain and phase the rollout.
- Publish decision logic so teams can execute without drift.

Examples

Use examples to pressure-test your assumptions before committing.

- A payments team modernized service by service and avoided full rewrite risk.
- A platform rebuild started in one domain first to lower migration risk.
- A legacy console stayed stable while APIs modernized underneath.

Templates

These templates are designed for working sessions, not slides.

- Modernize vs rebuild scorecard
- Domain-by-domain system health template
- Migration dependency map template
- Executive decision memo template

30-day plan

Use this as a practical first month plan.

- Week 1: Align on decision criteria and outcomes.
- Week 2: Complete domain health scan and risk map.
- Week 3: Compare options with cost, timing, and impact.
- Week 4: Commit path and publish phased execution plan.

Example walkthrough: phased modernizatio

A regulated team modernized incrementally while releases stayed active.

- Started with highest-risk integration points.
- Used compatibility layers for critical workflows.
- Reduced migration risk without freezing roadmap work.

Example walkthrough: rebuild one domain

A full rebuild was limited to one constrained domain first.

- Set success metrics before kickoff.
- Ran shadow traffic before wide cutover.
- Scaled only after production confidence was proven.

Template workbook: architecture memo

Capture rationale once so teams do not reopen the same debate.

- Current constraint and business impact
- Options considered and trade-offs
- Chosen path and why now
- Risks and mitigation owners

Template workbook: dependency heatmap

Use a heatmap to rank migration sequence.

- [ ] Critical dependency
- [ ] Impact if delayed
- [ ] Confidence score
- [ ] Owner and target date

Trade-off lens: speed vs certainty

Use this lens when teams disagree on risk tolerance.

- What must improve fast?
- What cannot break?
- What can be deferred safely?
- What decision is irreversible?

Team alignment prompts

Use these prompts in architecture review.

- Which assumptions are unproven?
- Which risks are known but unowned?
- Where are we over-scoping?
- What is the smallest useful first phase?

Phase-1 rollout checklist

Gate each move with explicit readiness checks.

- [ ] Test strategy approved
- [ ] Rollback plan validated
- [ ] Observability coverage confirmed
- [ ] Business owner sign-off captured

Example walkthrough: mixed strategy

A team rebuilt one domain while modernizing adjacent services.

- Kept customer-facing flows stable during migration.
- Reduced operational risk with phased cutovers.
- Improved developer speed before migration finished.

Executive update template

Use this one-page format for weekly leadership updates.

- Progress vs phase targets
- Top risks and mitigation status
- Cost trend vs plan
- Decisions needed this week

Final next step

- Choose one domain to test your decision logic this month.
- If the debate is still stuck, we can facilitate a decision session with your team.
- The goal is to move with confidence, not debate in circles.

How Amalgam can help

Founder Review

Get a clear read on what is stuck and what to do next.

Expert Guidance

Unblock one critical path and get delivery moving again.

Outcome Partnership

Stay supported while work ships and priorities keep changing.
